I would like to have an app developed that supports our organisation in planning, both for parties and for staff. It is important that the application gives us a clear and concise overview of who is working when and when events or parties are taking place. The focus is on user-friendliness and clarity, so that we can plan and coordinate efficiently. At a later stage, we want to expand the functionalities so that staff can also actively use the app. They should be able to easily sign up for available shifts at times that suit them. The app should therefore not only provide an internal overview but also be interactive with the team. Our aim is to make planning more flexible and better aligned with staff availability. We are therefore looking for a smart, scalable solution that can grow with us. The managers (6 people) must be able to create the parties: They must be able to add and manage the party information on the various dates. They must also be able to add staff members per department (start and end times will vary for each party) (departments: kitchen, Alice room, Noémie room, Chalet, Restaurant). The staff members (employees) +- 40 people must be able to consult the information. And, if necessary, they must also be able to register themselves on the various dates on which we still need employees. They must receive notifications when a message is posted and be able to respond to it.
